CHRISTIAN A. GOMEZ DIAZ

San Bernardino, CA | (951) 483-3847 | christiangomez811@gmail.com
linkedin.com/in/christian-gomez-81b231173 | github.com/Christian101GTZ | Portfolio

EDUCATION

California State University, San Bernardino — B.S. in Computer Science — Expected May 2027

- Minor in Data Science (in progress) | Dean's List every semester

San Bernardino Valley College — A.A.S. in Computer Science — May 2024

SKILLS & CERTIFICATIONS

Languages: Python, JavaScript, HTML, CSS
AI/ML: RAG, LLM pipelines, LangChain/LangGraph, Sentence Transformers, ChromaDB, Hugging Face, Gemini, Groq
Frameworks & Tools: React, Vite, Flask, SQLAlchemy, Supabase, Streamlit, Gradio, Pytest, Git, Docker Compose
Certifications: CodePath AI Engineering (AI110, AI201; Honors, 2026); CodePath Web Development (WEB101, WEB102; Honors, 2025–2026); Google Cloud Foundations (2025); CodePath AI301 and WEB103 in progress (Fall 2026)
Spoken Languages: English, Spanish (bilingual)

OPEN-SOURCE & CODE-REVIEW EXPERIENCE

PathReview — Open-Source Pull Request (open, under review) | *Python, Pytest* | PR #546 — Summer 2026

- The ingestion pipeline only recognized JavaScript and TypeScript by file name, so I added regex patterns that recognize the code itself (Issue #148). The two JavaScript/TypeScript tests now pass. The three other failing tests in that file, for database and Docker detection, were failing before my change.
- Caught and fixed a bug in my own PR: my pattern for Python's str also matched TypeScript's string type.

PathReview, CodePath course copy — AI301 Practice PR | *Python, Pytest, Docker Compose* | PR #117 — Fall 2026

- Added four integration tests for the auth middleware, the code that checks the login token: a missing token, a malformed one, an expired one, and one signed with the wrong secret (Issue #38). Ran them with and without Postgres and Redis through Docker Compose, matching CI.

CineLog API — Watchlist Feature (code-review simulation) | *Python, Flask, SQLAlchemy* | GitHub — 2026

- Took a starter watchlist feature in a Flask codebase and finished it through six scripted review comments: stopped duplicate entries, set the order items come back in, added tests, and rebased my work after the project switched its IDs to UUIDs.
- Found a crash the existing tests missed by testing the feature end to end, then added a test so it can't come back (8 passing).

PROJECTS

PS5 Game Discovery RAG | *Python, Sentence Transformers, ChromaDB, Groq, Gradio* | GitHub — 2026

- Built a RAG pipeline over 10 sources (212 chunks): MiniLM turns the text into embeddings, ChromaDB finds the closest chunks, a reranker orders them, and Llama 3.3 70B answers from the top 5. Every answer names its sources.
- Switched to one game per chunk after chunks with several games made retrieval worse; scored retrieval and answers separately.

VibeCheck — Hybrid AI Music Recommender | *Python, Streamlit, Gemini 2.5 Flash* | GitHub — 2025 – 2026

- Gemini reads what the user asks for and turns it into a set of preferences. A rule-based engine scores a catalog of 300 songs I labeled by hand. If Gemini rates the results low-confidence, the engine drops the energy requirement and scores again.
- Tested with 7 user profiles, including tricky cases. An experiment showed that changing the scoring weights alone made results worse. Documented bias in the song catalog in a model card.

FitFindr — Three-Tool LLM Workflow | *Python, Groq, Llama 3.3 70B, Gradio, Pytest* | GitHub — 2026

- A thrift-shopping assistant that runs three tools in order: a keyword search over 40 listings, an outfit suggestion from Llama 3.3 70B, then a short caption. A loop I wrote by hand passes each result to the next step and stops after the search if nothing matches, so the model never styles an item that doesn't exist. 5 tests.

The Archive — Full-Stack Media Preservation Platform | *React, Vite, Supabase* | GitHub | Live Demo — 2026

- Launched an app where signed-in users post, edit, search, vote on, and comment on media, with images stored in Supabase Storage. Each user's votes live in their own rows, and Row Level Security policies stop anyone from changing data that isn't theirs.

RESEARCH

CSUSB AI Research Lab — Undergraduate Researcher (Mentor: Dr. Alzahrani) — Spring 2025

- Co-wrote a proposal for OpportunityScout, an AI agent that matches students with internships, scholarships, and research. Started a prototype using LangChain/LangGraph, a local Mistral 7B model (Ollama), Playwright web scraping, and Docker.

EXPERIENCE & LEADERSHIP

Pollo Campero — Cashier / Team Member, San Bernardino, CA — March 2023 – Present

- Worked 3+ years in a bilingual (English/Spanish) customer-service role while attending school and transferring to CSUSB.

California College Corps — College Corps Fellow, San Bernardino, CA — Aug 2025 – May 2026

- Completed a 450-hour fellowship mentoring middle-school AVID students with one-on-one academic support.
